

DZPHARM · DISCOVERABILITY LAYER

SEO & Metadata

A detailed deep-dive into the SEO architecture: JSON-LD structured data (MedicalWebPage + MedicalAudience schemas), OG/Twitter base tags (og:locale=fr_DZ), robots.txt allowing all crawlers. Four gaps: no og:image, no canonical URL, no hreflang alternates, and a sitemap with a single URL pointing to a non-resolving domain. The 9,555 medication pages are invisible to Google.

Feature #4 – SEO & Metadata
From the 68-item review menu

JSON-LD • Senior-Level Implementation

SEO is **better than the earlier #1 Routing report suggested**. JSON-LD structured data IS present with two schemas in one `@graph` : `WebSite` (platform-level entity) and `MedicalWebPage` (page-level entity) with `MedicalAudience` (`audienceType`: «`pharmacien`»). This is senior-level SEO implementation — the structured data tells Google this is a medical platform for pharmacists specifically.

1.1 The JSON-LD @graph

```
<script type="application/ld+json">
{{
  "@context": "https://schema.org",
  "@graph": [
    {{
      "@type": "WebSite",
      "@id": "https://dzpharm.dz/#website",
      "url": "https://dzpharm.dz/",
      "name": "DzPharm",
      "description": "Plateforme d'intelligence pharmaceutique...",
      "inLanguage": "fr"
    }},
    {{
      "@type": "MedicalWebPage",
      "@id": "https://dzpharm.dz/#webpage",
      "url": "https://dzpharm.dz/",
      "name": "DzPharm — Référentiel Pharmaceutique Algérien",
      "about": "nomenclature pharmaceutique algérienne",
      "inLanguage": "fr",
      "audience": {{
        "@type": "MedicalAudience",
        "audienceType": "pharmacien"
      }}
    }}
  ]
}}
</script>
```

1.2 Why This Is Excellent

Two schemas in one `@graph` : `WebSite` (the platform-level entity) and `MedicalWebPage` (the page-level entity). The `MedicalAudience` with `audienceType` «`pharmacien`» tells Google this content is for pharmacists specifically — important for query intent matching. The use of `@id` enables cross-page entity linking. This is senior-level SEO implementation rarely seen in healthcare platforms.

WHAT WORKS · JSON-LD STRUCTURED DATA

Two schemas (WebSite + MedicalWebPage) with MedicalAudience (audienceType: «pharmacien»). The `@id` fields enable entity linking. The `inLanguage: fr` is correct for the Algerian market. This is senior-level SEO implementation.

CHAPTER 02 · OG & TWITTER TAGS

Open Graph + Twitter Cards

The OG (Open Graph) and Twitter Card base tags are correct: `og:title`, `og:description`, `og:locale=fr_DZ`, `og:type=website`, `twitter:title`. Four tags are missing: `og:image`, `og:url`, `og:site_name`, `twitter:image`. The `twitter:card` is «summary» (should be «summary_large_image» for better visual impact).

TAG	VALUE	STATUS
og:title	DzPharm — Référentiel Pharmaceutique Algérien	PASS
og:description	Plateforme d'intelligence pharmaceutique algérienne...	PASS
og:locale	fr_DZ (Algeria-specific French)	PASS
og:type	website	PASS
og:image	NONE	FAIL
og:url	NONE	FAIL
og:site_name	NONE	MISSING
twitter:card	summary (should be summary_large_image)	SUBOPTIMAL
twitter:title	DzPharm — Référentiel Pharmaceutique Algérien	PASS
twitter:image	NONE	FAIL
twitter:site	NONE (@DzPharmDZ?)	MISSING

2.1 The og:image Gap

Without `og:image`, any link shared to Facebook, Twitter, LinkedIn, or WhatsApp shows a text-only preview — no visual branding. A branded OG image (1200×630px, featuring the DzPharm logo + tagline) would make every shared link visually distinctive. Effort: 1 hour to design the image + 5 minutes to add the `og:image` meta tag. This is one of the highest-ROI SEO fixes — every social share becomes a branded impression.

2.2 The og:locale = fr_DZ

The `og:locale` is set to `fr_DZ` — the correct Facebook/Open Graph locale code for French as spoken in Algeria. This is more specific than `fr_FR` and helps social platforms serve the right regional content.

This is a thoughtful touch — most platforms just use `fr_FR` for all French content.

Single URL Pointing to Non-Resolving Domain

The sitemap is the most consequential SEO gap. `sitemap.xml` contains exactly one URL entry pointing to `https://dzpharm.dz/` — a domain that does NOT resolve in DNS. The 9,555 medication pages, 12 clinical tools, AI copilot, interactions checker, and parapharmacy catalogue are all invisible to search crawlers. The potential SEO surface is 10,000+ indexable pages; the actual surface is zero.

This XML file does not appear to have any style information associated with it. The document tree is shown below.

```
<?xml version="1.0" encoding="UTF-8"?>
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
  <url>
    <loc>https://dzpharm.dz/</loc>
    <lastmod>2026-08-31</lastmod>
    <changefreq>monthly</changefreq>
    <priority>1.0</priority>
  </url>
</urlset>
```

Figure 4.1 — `sitemap.xml` as served by `dz-pharm.vercel.app`. Contains exactly one URL entry pointing to `https://dzpharm.dz/` — a domain that does NOT resolve in DNS. The `robots.txt` also references this domain. 9,555 medication pages are invisible to Google.

3.1 Two Sitemap Defects

Defect 1: wrong domain — the sitemap is served from `dz-pharm.vercel.app` but lists `dzpharm.dz`, which doesn't resolve in DNS. Google will discard it. Defect 2: single URL — only the homepage is listed. The 9,555 medications, 12 clinical tools, AI copilot, interactions checker, and parapharmacy catalogue are all invisible to search crawlers. The potential SEO surface is 10,000+ indexable pages; the actual surface is zero.

3.2 The Fix • Dynamic Sitemap

The fix is a dynamic `sitemap.xml` that lists every medication page. Next.js App Router supports this via `app/sitemap.ts`:

```
// app/sitemap.ts
import {{ getMedications }} from '@/lib/data';

export default async function sitemap() {{
  const meds = await getMedications();
  const baseUrl = 'https://dz-pharm.vercel.app'; // or dzpharm.dz once DNS resolves

  const staticPages = [
    {{ url: `/${baseUrl}/`, priority: 1.0 }},
    {{ url: `/${baseUrl}/repertoire`, priority: 0.9 }},
    {{ url: `/${baseUrl}/interactions`, priority: 0.8 }},
    {{ url: `/${baseUrl}/copilote`, priority: 0.7 }},
  ];

  const medPages = meds.map(m => ({{
    url: `/${baseUrl}/medicament/${m.slug}`,
    lastModified: m.updatedAt,
    priority: 0.6,
  })));

  return [...staticPages, ...medPages];
}}
```

THE SEO VISIBILITY GAP

The sitemap lists 1 URL; the platform has 10,000+ pages. The 9,555 medication records, each of which could be an organic landing page capturing high-intent traffic, are all dark. If each medication page were indexed and captured an average of 20 visits/month from Algerian searchers, that would be ~190K monthly organic visits. At a typical pharmacy-CPM of 5, *that's* 950/month in equivalent ad spend — or, more valuably, ~190K monthly opportunities to convert a searcher into a DzPharm user.

Crawl Directives

The robots.txt is well-formed — it explicitly allows Googlebot, Bingbot, Twitterbot, and facebookexternalhit. The `User-agent: *` + `Allow: /` opens the site to all crawlers. But there's no canonical URL tag on any page, and no hreflang alternates — both missed SEO opportunities.

4.1 The robots.txt

```
User-agent: Googlebot
Allow: /

User-agent: Bingbot
Allow: /

User-agent: Twitterbot
Allow: /

User-agent: facebookexternalhit
Allow: /

User-agent: *
Allow: /

Sitemap: https://dzpharm.dz/sitemap.xml ← points to non-resolving domain
```

4.2 The Missing Canonical

No `<link rel="canonical" href="...">` tag on any page. Canonical URLs prevent duplicate-content penalties — without them, Google may index both `dz-pharm.vercel.app/` and `dz-pharm.vercel.app?ref=share` as separate pages, splitting the ranking signal. Effort: 30 minutes to add `<link rel="canonical" href={canonicalURL} />` in the layout.

4.3 The Missing hreflang

No `<link rel="alternate" hreflang="...">` elements. Even for a single-language site, declaring `hreflang="fr"` + `hreflang="x-default"` on every page helps international SEO. If Arabic or English versions are ever added, hreflang is essential. Effort: 30 minutes.

— CHAPTER 05 · VERDICT & FIX PLAN

Final Assessment

SEO & Metadata is a **B+ grade feature**. The JSON-LD structured data is senior-level (two schemas, MedicalAudience). The OG/Twitter base tags are correct (og:locale=fr_DZ). The robots.txt is well-formed. Four gaps: no og:image, no canonical, no hreflang, and the sitemap problem (1 URL pointing to a non-resolving domain). The sitemap is the most consequential — it makes 10,000+ pages invisible to Google.

5.1 Phased Fix Plan

PHASE	FIXES	EFFORT	OUTCOME
Phase 1 · Now (Today)	Fix sitemap domain + add og:image + canonical	~2 hours	Grade lifts to A- . Sitemap works, social shares branded.
Phase 2 · Next (After #1 Routing)	Dynamic sitemap with all 9,555 medication pages	~1 day	Grade lifts to A. 10,000+ pages indexable.
Phase 3 · Later	hreflang alternates + per-page OG images	~2 days	Nice-to-have. International SEO + per-page social cards.

5.2 Cross-Feature Dependencies

- ✓ Feature #1 (Routing) — the dynamic sitemap needs real routes (/medicament/[slug]); defer Phase 2 until #1 ships
- ✓ Feature #5 (PWA) — the manifest is part of the discoverability layer; covered in #5
- ✓ Feature #6 (i18n) — hreflang alternates depend on the i18n strategy; covered in #6
- ⚠ Feature #3 (Performance) — the SEO score (85-90) affects Lighthouse; covered in #3

5.3 Final Assessment

2 JSON-LD SCHEMAS	4 OG TAGS CORRECT	4 SEO GAPS
B+ GRADE	~2h PHASE 1 EFFORT	~1d PHASE 2 EFFORT

FINAL VERDICT · B+ GRADE, 2 HOURS FROM A-

SEO & Metadata is a **B+ grade feature**. The JSON-LD structured data is senior-level — two schemas (WebSite + MedicalWebPage) with MedicalAudience (audienceType: «pharmacien»). The OG/Twitter base tags are correct (og:locale=fr_DZ). The robots.txt is well-formed. Four gaps prevent an A grade: no og:image (1 hour), no canonical URL (30 min), no hreflang (30 min), and the sitemap problem (1 URL pointing to non-resolving domain — the most consequential, making 10,000+ pages invisible to Google). Phase 1 (2 hours — fix sitemap domain + og:image + canonical) lifts the grade to A-. Phase 2 (1 day, after #1 Routing ships — dynamic sitemap with all 9,555 medication pages) lifts it to A and unlocks the 190K monthly organic visits opportunity.

Immediate Next Steps

1. Fix the sitemap domain: change dzpharm.dz to dz-pharm.vercel.app — 5 minutes.
2. Design and add an og:image (1200×630px, branded) — 1 hour.
3. Add `<link rel="canonical">` to the layout — 30 minutes.
4. Add hreflang="fr" + hreflang="x-default" — 30 minutes.
5. Defer dynamic sitemap (Phase 2) until #1 Routing ships.

4

Senior JSON-LD, correct OG tags, well-formed robots.txt. Sitemap has 1 URL — 10,000+ pages invisible. 2 hours lifts to A-.
