

DZPHARM · ON-CALL DIRECTORY

Pharmacies de Garde

A detailed deep-dive into the on-call pharmacy directory: 52 pharmacies across 17 wilayas, name/wilaya search, "Annuaire indicatif — vérifiez par téléphone" disclaimer, and SAMU 14 reminder. Functional and uniquely useful for the Algerian market — but the dataset is sparse (17/58 wilayas), the per-pharmacy schema is light (no opening hours, no GPS coordinates, no phone link), and there is no refreshing cadence visible to the user.

Feature Overview & Inventory

The **Pharmacies de garde** directory is one of three "bonus" tools discovered during the clinical tools sweep (#24-#34) and was formally assigned feature number **#35** in the 68-item review menu. It is a community-facing utility that lists pharmacies operating outside of standard business hours across Algerian wilayas, with explicit safety framing ("Annuaire indicatif — vérifiez par téléphone avant de vous déplacer") and a SAMU 14 reminder for medical emergencies.

Outils cliniques

Calculateurs et aides à la dispensation adaptés aux spécificités algériennes — posologies pédiatriques, fonction rénale, grossesse & allaitement, remboursement Chifa, adaptation Ramadan et comparateur de médicaments.

Vérification d'ordonnance

Collez une ordonnance complète — DzPharm identifie les médicaments et contrôle les interactions d'un seul coup.

DOLIPRANE 1000 mg
AMLODIPINE 5 mg
MOPRAL 20 mg

Figure 35.1 — Pharmacies de garde default view. Header with title and disclaimer banner. Statistics: 52 pharmacies across 17 wilayas. Search box (name + wilaya filter). Card list with pharmacy name, wilaya, address, and phone number. SAMU 14 reminder banner at top.

The directory is accessed from the clinical tools hub as a dedicated tab labeled "Pharmacies de garde", positioned between the Shortage Reporting Center (Feature #50, "Centre de signalement des pénuries") and the Barcode Scanner (Feature #34). It is the only tool in the suite that targets the patient/general-public audience rather than the clinician audience — every other tab in the clinical hub assumes a medical professional user. This makes #35 a strategic bridge feature: it converts DzPharm from a "pharmacist's tool" into a "everyone's tool", which matters for adoption, shareability, and the platform's long-term position as the public reference for Algerian pharmaceutical intelligence.

1.1 Discovery & Inventory

The tool was not in the original review menu. It was discovered during testing of the clinical tools hub (#24-#34 sweep) as a tab that did not correspond to any of the 11 originally listed tools. The team has since confirmed it as a first-class feature and assigned it #35. The discovery pattern is now familiar: DzPharm ships faster than its review menu can track, and the audit trail keeps catching up. The same discovery pattern produced the Shortage Reporting Center (now #50) and the Generics Savings Simulator (still unassigned).

1.2 Strategic Positioning

Three observations make this feature strategically important despite its modest dataset. First, it is the only DzPharm tool aimed at the general public rather than clinicians — every other tab assumes medical literacy. Second, on-call pharmacy directories are a public-health staple in markets with limited ambulance reliability (Algeria, France, Spain, Italy); DzPharm is the first Algerian platform to ship one with a clean UX. Third, the disclaimer ("Annuaire indicatif — vérifiez par téléphone") signals regulatory awareness — the team understands the legal exposure of publishing pharmacy hours that may be outdated, and they front-load the disclaimer rather than bury it. This is the right instinct.

WHY THIS FEATURE MATTERS

Algeria's healthcare system has uneven ambulance coverage outside major cities. For a parent in Oran at 02:00 with a febrile child, the difference between "drive around hoping to find an open pharmacy" and "open DzPharm, see Pharmacie El Baraka is on call, call ahead, drive there" can be a 30-minute saving — and a 30-minute saving at 02:00 with a sick child is the difference between a manageable night and an ER visit. The directory is not a "nice to have"; it is a genuine utility.

Coverage, Schema & Freshness

The directory has **52 pharmacy records across 17 of 58 Algerian wilayas**. Each record has three fields: pharmacy name, wilaya, and a contact line (phone or address). The schema is intentionally minimal — but the minimalism has costs, and the coverage has visible gaps.

2.1 Geographic Coverage

The 17 covered wilayas represent the major population centers: Alger (capital), Oran, Constantine, Annaba, Blida, Sétif, Tizi Ouzou, Laghouat, and 9 others. The 41 uncovered wilayas include both sparsely populated southern wilayas (Tamanrasset, Illizi, Tindouf, Adrar) and several densely populated northern wilayas that one would expect to see covered — Béjaïa, Tlemcen, Mostaganem, Skikda. The directory is therefore "useful for the coastal axis, sparse for the interior, absent for the south". This is the inverse of where on-call pharmacy data is hardest to find elsewhere — the south is precisely where DzPharm's directory would be most valuable, because southern wilayas have weaker general-public search infrastructure.

COVERED WILAYA	PHARMACIES LISTED	NOTES
Alger	~14	Densest coverage — capital, expected
Oran	~6	Second-largest city, healthy count
Constantine	~4	Third-largest city, adequate
Annaba	~3	Coastal northeast
Blida	~3	Greater Algiers suburbs
Sétif	~3	High plateau, major city
Tizi Ouzou	~2	Kabylia region
Laghouat	~2	Steppes, smaller population
8 other wilayas	~15 total	1-3 pharmacies each

COVERAGE GAP · 41/58 WILAYAS MISSING

The directory covers 17 of 58 wilayas (29%). Notably missing: Béjaïa, Tlemcen, Mostaganem, Skikda, Batna, Biskra, Tamanrasset, Ouargla. The uncovered set includes both large northern cities (where data should be easiest to source) and southern wilayas (where the directory would have the most unique public-health value). Compare with the Shortage Reporting Center (#50), which covers all 58 wilayas — the same team has clearly demonstrated it can enumerate all 58 wilayas when it chooses to.

2.2 Record Schema

Each pharmacy record exposes three fields: name, wilaya, and a contact line. The contact line is typically a phone number formatted as a clickable `<a href="tel: ...">` link (verified in the accessibility tree — clickable on mobile, announced as "lien, téléphone" by NVDA). The schema omits several fields

that would materially increase the directory's utility, and the omissions are the single biggest source of "B+" rather than "A" on the grade.

FIELD	PRESENT	WHY IT MATTERS	EFFORT TO ADD
Pharmacy name	YES	Identity	—
Wilaya	YES	Geographic bucket + filter	—
Phone	YES	Verified-by-call disclaimer relies on this	—
Address	PARTIAL	Some records have street address, most don't	M (data sourcing)
Opening hours (on-call window)	NO	Critical — without hours, "on-call" is ambiguous	S (schema add)
GPS coordinates (lat/lng)	NO	Map view + proximity sort impossible without this	M (geocoding pass)
Last verified date	NO	No freshness signal — user cannot tell if a record is 1 week or 1 year old	S (timestamp add)
Source / submitter	NO	No provenance — trust relies on platform brand alone	S (provenance field)
"Surveiller" (watch)	NO	Shortage center has watch — pharmacies don't, asymmetric UX	M (subscription system)

2.3 Freshness Signals

The directory has no visible "last updated" timestamp. There is no per-record freshness indicator (e.g., "verified 2026-08-15"). There is no aggregate "directory last refreshed: YYYY-MM" banner. By contrast, the Prix & Chifa data carries "Dernière vérification: Août 2026" timestamps — the platform has a freshness-signaling pattern, it just hasn't been applied to #35. Without freshness signals, the disclaimer ("Annuaire indicatif — vérifiez par téléphone") is doing all the trust work, and that is a fragile position: a single documented case of "I drove 30 km based on DzPharm's listing and the pharmacy was closed" erodes the platform's credibility on every other feature too.

Recommendation · Freshness Layer (1 day)

Add three freshness signals: (1) per-record `lastVerifiedAt` ISO timestamp, (2) record-level "Vérifié" badge if `lastVerifiedAt` is within 30 days, (3) aggregate "Mis à jour le YYYY-MM" header banner above the search box. Reuse the existing freshness pattern from Prix & Chifa for visual consistency. Effort: 1 day, mostly a data pass + a small UI addition.

Search, Filter & User Experience

The directory exposes **two search modes**: a free-text search box (filters by pharmacy name) and a wilaya selector (filters by region). Both work, both are fast, and both produce instant visual feedback. But the search experience omits three patterns that would

meaningfully improve task completion for the actual user flow ("find the nearest on-call pharmacy right now").

3.1 Search Modes & Their Behavior

The free-text search is a substring match against pharmacy names — typing "el baraka" returns "Pharmacie El Baraka", typing "alger" returns no results (because the search matches pharmacy name, not wilaya). This is a minor UX trap: users intuitively expect that searching "alger" will return pharmacies in Alger, but it returns zero results because none of the 14 Alger pharmacies have "alger" in their name. The wilaya selector compensates for this, but the dual search modes create an inconsistent mental model. A unified search that matches both name and wilaya would be a 2-hour fix with outsized UX benefit.

Bug #1 · Free-text search ignores wilaya

Searching "alger" returns 0 results because the search box only matches pharmacy name, not wilaya. Expected behavior: substring match across both name AND wilaya fields. Effort to fix: XS (1 hour). Add `pharmacy.name.includes(query) || pharmacy.wilaya.includes(query)` to the filter predicate.

3.2 Result Card UX

Each result is rendered as a card with: pharmacy name (bold), wilaya (small uppercase label), phone (clickable link), and address (when present). The card uses the same visual treatment as the medication detail card in the Répertoire (#17) — consistent with the platform's design system. The phone link uses `<a href="tel:...">`, which on mobile triggers the native dialer (verified on iPhone 14 Pro at 390×844). On desktop, clicking opens the OS dialer prompt or does nothing visible, which is correct desktop behavior.

3.3 The SAMU 14 Reminder Banner

A persistent banner at the top of the directory reads "**SAMU 14 — En cas d'urgence vitale, appelez le 14**". This is the same emergency-banner pattern as the authenticated dashboard (covered in the Nav Layer Quintet report). The placement is correct: it is the first element the user reads when they land on the directory, which is the right information hierarchy for a "I have a sick family member at 02:00 and I'm looking for a pharmacy" scenario. The banner is dismissible on the dashboard but appears persistent here — a reasonable choice given the safety context.

WHAT WORKS · SAMU BANNER PLACEMENT

The SAMU 14 banner is correctly placed at the top of the directory view, before the search box and result list. The visual treatment (sky-blue accent border, bold red text for "14") is consistent with the global emergency-banner pattern. This is a textbook safety-first design pattern: surface the most life-critical action first, then the directory utility. No fix needed.

3.4 Disclaimer Copy & Trust Framing

The disclaimer reads: "*Annuaire indicatif — vérifiez par téléphone avant de vous déplacer*". This is the single most important sentence on the page. It does three things at once: (1) it sets the user's expectation that the data may be stale, (2) it tells the user the right next action ("call first, don't just drive"), and (3) it limits DzPharm's legal exposure if a pharmacy is closed. The copy is well-written — concise, action-

oriented, in the right register. The only improvement would be to make the disclaimer dismissible-per-session (so a returning user doesn't see it every time) and to make the "vérifiez par téléphone" phrase a clickable link that triggers the dialer for the selected pharmacy. Currently the disclaimer is pure text — connecting it to the action would close the loop.

3.5 Mobile Behavior

At 390×844 (iPhone 14 Pro), the directory adapts cleanly: the search box stretches to full width, the result cards stack vertically with full-width phone links (44×44 tap target minimum met), and the wilaya selector becomes a native `<select>` dropdown. The SAMU banner collapses to its numbers ("SAMU 14 · URGENCES") — same collapse pattern as the authenticated dashboard. Mobile UX is solid; no regression detected.

Pass · Mobile Adaptation

All search patterns (text input, wilaya dropdown, result cards, phone links) adapt correctly to mobile dimensions. Tap targets meet WCAG 2.2 AA (44×44 minimum). The wilaya dropdown uses native `<select>` which is the correct choice on mobile (avoids custom-dropdown scroll traps). No fix needed.

CHAPTER 04 · GAPS & BUGS

Five Concrete Gaps in #35

Five gaps separate the current implementation from a production-grade on-call pharmacy directory. None are blockers — the feature is usable as shipped — but the cumulative effect is that #35 underdelivers on its own potential. Total fix effort: **~7-10 engineering days** for the five gaps combined.

#	GAP	IMPACT	EFFORT	FIX
1	Free-text search ignores wilaya	Searching "alger" returns 0 results — counter-intuitive	XS (1h)	Add <code>wilaya.includes(query)</code> to filter predicate
2	41/58 wilayas uncovered	Southern + several northern wilayas missing	L (data sourcing, 1-2 weeks)	Partnership with wilaya health directorates; or open submission
3	No opening hours / on-call window	"On-call" is ambiguous — is it 24/7? Night only? Weekends?	S (1 day)	Add <code>onCallHours</code> field, render as small label under phone
4	No GPS coordinates / map view	Cannot sort by proximity, cannot show map pin	M (3 days)	Geocode addresses, add a Leaflet map tab alongside the list view
5	No freshness signal	User cannot tell if a record is 1 week or 1 year old	S (1 day)	Add per-record <code>lastVerifiedAt</code> , show "Vérifié YYYY-MM" badge

4.1 Gap #1 — Search Predicate (Critical, 1 hour)

The search box currently filters using `pharmacy.name.toLowerCase().includes(query.toLowerCase())`. This is the single most fixable gap and the one with the highest UX-to-effort ratio. The fix is a 1-line change in the filter predicate:

```
// Before - name-only match
const results = pharmacies.filter(p =>
  p.name.toLowerCase().includes(q)
);

// After - name OR wilaya match
const results = pharmacies.filter(p =>
  p.name.toLowerCase().includes(q) ||
  p.wilaya.toLowerCase().includes(q)
);
```

4.2 Gap #2 — Coverage Expansion (Strategic, 1-2 weeks)

Expanding from 17 to 58 wilayas is a data-sourcing exercise, not an engineering exercise. Three paths are available: (1) partnership with wilaya-level health directorates (Direction de la Santé et de la Population), which is the official source of on-call rotation schedules; (2) crowdsourced submissions from pharmacists themselves, mirroring the Shortage Reporting Center's pattern (#50); (3) web scraping of the wilaya-level official pharmacy order publications (each wilaya's order of pharmacists publishes weekly on-call rotations). Path 2 is the fastest to ship — the submission form would reuse the Shortage Center's form pattern, with the same wilaya selector (which already has all 58 wilayas), and a moderation queue. Recommend path 2 with path 3 as an automated ingestion pipeline for the 6 largest wilayas (Alger, Oran, Constantine, Annaba, Blida, Sétif).

4.3 Gap #3 — On-Call Hours Schema

"Pharmacie de garde" in Algeria has a specific legal meaning: it refers to the pharmacy designated to be open outside of standard business hours during a defined period (typically nights 8 PM - 8 AM, weekends, and public holidays). The current directory does not surface this window. Adding an `onCallHours` field (e.g., "Nuit 20h-08h · Week-ends · Jours fériés") rendered as a small label under the phone would resolve the ambiguity. Effort: 1 day (schema + UI), assuming the data is available from the source.

4.4 Gap #4 — Map View & Proximity Sort

The biggest UX improvement, and the most expensive. Today, a user in Bab El Oued looking for the nearest on-call pharmacy must scroll the entire list and visually compare wilaya labels. A map view (Leaflet + OpenStreetMap, no API key needed) with proximity sort would transform the experience: the user grants location permission, sees pins for the 5 nearest on-call pharmacies, and taps to call. Effort: 3 days (geocoding pass + map component + proximity sort). Recommend deferring to after Gap #2 (coverage) — there's no point rendering 52 pharmacies on a map when 41 wilayas are missing.

4.5 Gap #5 — Freshness Layer

Covered in section 2.3. Adding a per-record `lastVerifiedAt` timestamp and showing a "Vérifié YYYY-MM" badge would close the trust gap. Effort: 1 day, mostly a backend data pass + small UI addition. This is the cheapest gap to close and the one that most directly addresses the disclaimer's underlying concern ("the data may be stale").

Final Assessment & Phased Rollout

The Pharmacies de Garde directory is a **functional, useful, and uniquely Algerian feature**. It is the only DzPharm tool aimed at the general public rather than clinicians, which makes it strategically important for adoption. The implementation is clean — search works, the SAMU banner is correctly placed, mobile adaptation is solid. But the dataset is sparse (17/58 wilayas), the schema is light (no hours, no GPS, no freshness), and the search has a counter-intuitive blind spot (wilaya not in the search predicate). Total grade: **B** — production-grade foundation, needs data and schema enrichment to reach A.

5.1 Phased Fix Plan

Three phases, ranked by impact-to-effort ratio. Phase 1 (Now) closes the search bug and adds freshness — both one-day fixes. Phase 2 (Next) adds the schema fields and the crowds submission pipeline. Phase 3 (Later) ships the map view once coverage is broad enough to justify it.

PHASE	FIX	EFFORT	WHY THIS ORDER
Phase 1 · Now (Week 1-2)	Fix #1 (search predicate) + Fix #5 (freshness layer)	XS (1 hour) + S (1 day) = ~2 days	Cheapest fixes, highest UX-to-effort ratio. Ship immediately.
Phase 2 · Next (Week 3-6)	Fix #2 (coverage expansion via crowdsourced submissions) + Fix #3 (on-call hours schema)	L (2 weeks) + S (1 day) = ~3 weeks	Coverage is the strategic gap. Hours is the schema gap. Both unlock the map view.
Phase 3 · Later (Quarter 2)	Fix #4 (map view + proximity sort)	M (3 days)	Only worth shipping once coverage reaches ~40 wilayas. Otherwise the map looks empty.

5.2 Cross-Feature Dependencies

Feature #35 connects to four other features in the 68-item review menu. Each connection is a "build this and you unlock that" relationship — closing gaps in #35 has compounding returns across the platform.

✓ Feature #1 (Routing) — directory should live at `/pharmacies-de-garde`, currently no URL (modal-only)

- ✓ Feature #2 (State Management) — selected wilaya should persist in Zustand, currently resets on refresh
- ✓ Feature #8 (Authentication Model) — submission form (Phase 2) needs per-pharmacist accounts
- ✓ Feature #49 (Sharing System) — should support "share this pharmacy" deep links, currently impossible without URL
- ⚠ Feature #50 (Shortage Reporting Center) — shares the same wilaya selector and crowdsourcing pattern. Build submission form once, reuse for both.

5.3 Final Assessment

PHASE 1 EFFORT

~3w

PHASE 2 EFFORT

FINAL VERDICT · B GRADE, STRONG FOUNDATION

The Pharmacies de Garde directory is **the right feature, in the right place, with the right disclaimer**. It is the only DzPharm tool aimed at the general public, which gives it outsized strategic importance for adoption and shareability. The implementation is clean — no bugs in the core flow, mobile UX is solid, SAMU banner placement is correct. The gaps are in data (41 wilayas missing) and schema (no hours, no GPS, no freshness), not in code. Phase 1 (search fix + freshness) ships in 2 days and lifts the grade to B+. Phase 2 (coverage + hours) is a 3-week data exercise that lifts it to A-. Phase 3 (map view) is the eventual differentiator. The feature is worth investing in — it is a public-health utility that no Algerian competitor offers.

Immediate Next Steps

1. Fix the search predicate (name OR wilaya match) — 1 hour, ship today.
2. Add per-record `lastVerifiedAt` field + "Vérifié YYYY-MM" badge — 1 day.
3. Add `onCallHours` field, render as small label under phone — 1 day.
4. Design the crowds submission form (reuse Shortage Center pattern from #50) — 1 day design, 3 days build.
5. Defer the map view (Phase 3) until coverage reaches ~40 wilayas.

35

52 pharmacies, 17 wilayas, 5 gaps. Functional foundation, sparse data. Phase 1 fixes (2 days) lift to B+. Phase 2 coverage expansion (3 weeks) lifts to A-.
