

DZPHARM · MEDICATION DETAIL

Sharing System

A detailed deep-dive into the sharing system: the «Partager la fiche» button opens the medication detail modal (which IS the shareable content), but there's no copyable URL, no Web Share API integration, and no dedicated share dialog. The URL stays at `?q=DOLIPRANE` (search state, not a deep link). Sharing is the weakest user-action feature.

Executive Summary

The Sharing System is the **weakest user-action feature**. The «Partager la fiche de DOLIPRANE» button opens the medication detail modal — which is rich, shareable content — but there is no way to share it. No copyable URL field, no «Copier le lien» button, no Web Share API integration (`navigator.share` is undefined). The URL stays at `?q=DOLIPRANE` (search state, not a medication deep link). A pharmacist who finds critical information cannot send it to a colleague.

The Three Gaps

Gap 1 · No copyable URL

The «Partager» button opens the medication detail modal but the URL doesn't change to a medication-specific deep link. The URL stays at `?q=DOLIPRANE` — a search query, not a medication page. If a pharmacist copies the URL and sends it, the recipient lands on the dashboard with the search pre-populated, not on the medication detail. They must click through manually.

Gap 2 · No «Copier le lien» button

The modal has 6 action buttons (Partager, Favoris, Imprimer, Code-Barres, Rupture, Signaler pénurie) but none of them copies a shareable URL to the clipboard. The #43 Toast report confirmed the Copilot has a «Copier la réponse» button that works — the medication detail needs the equivalent «Copier le lien».

Gap 3 · No Web Share API integration

`navigator.share` is `undefined` — the platform doesn't use the Web Share API. On mobile (where sharing is most common), the native share sheet would let a pharmacist send the medication info to WhatsApp, SMS, or email with one tap. Adding `navigator.share({title, text, url})` would enable this.

What Works · Rich Shareable Content

The medication detail modal (opened by the «Partager» button) contains genuinely rich, shareable content — brand, DCI, dosage, status, Chifa pricing, AMM number, therapeutic domain, availability, and a 7/7 completeness score. The content IS worth sharing. The gap is in the sharing mechanism, not the content.

Figure 49.1 – Medication detail modal for DOLIPRANE opened via «Partager». The modal shows: brand, DCI (PARACETAMOL), dosage (100MG), status (Actif), flag (DZ), Chifa CNAS indicator, AMM number, 7/7 completeness score, PPA (124.06 DA), CNAS reimbursement (99 DA + 25.06 DA ticket modérateur), therapeutic domain, and availability status. This is the shareable content – but no mechanism to share it.

2.1 The Shareable Content Summary

FIELD	VALUE
Brand	DOLIPRANE
DCI	PARACETAMOL
Dosage	100MG
Form	SUPPOSITOIRE · B/10
Statut	Actif
Origin	DZ ALGERIE · Produit local
Chifa	CNAS 80% (99 DA) / ALD 100%
PPA	124.06 DA
Ticket modérateur	25.06 DA
AMM	201/03 B 007/00/24
Domaine	Antalgiques & Anti-inflammatoires
Complétude	7/7 (Fiche complète + Prix PPA + Fiche produit + RCP + Livre)

THE CONTENT IS EXCELLENT — THE MECHANISM IS MISSING

The medication detail modal contains exactly what a pharmacist would want to share: brand + DCI + dosage + price + reimbursement + AMM + availability. The completeness score (7/7) is a nice trust signal. The content is ready to share — the platform just needs a sharing mechanism (copy URL, Web Share API, or export as text/image).

CHAPTER 03

The Fix · Copy Link + Web Share API

Three changes would close all 3 gaps. The first depends on the Feature #1 routing migration (medication detail needs a real URL). The second and third can ship immediately.

3.1 Add «Copier le lien» Button (after Feature #1 ships)

```
// In the medication detail modal action bar
<Button onClick={() => {{
  const url = `https://dz-pharm.vercel.app/medicament/${med.slug}`;
  navigator.clipboard.writeText(url);
  toast.success("Lien copié", {
    description: `Lien vers ${med.brand} copié dans le presse-papier.`,
  });
}}}>
  Copier le lien
</Button>
```

3.2 Add Web Share API (works immediately, no routing dependency)

```
// In the Partager button handler
const handleShare = async () => {{
  const shareData = {{
    title: `DzPharm - ${med.brand}`,
    text: `${med.brand} (${med.dci}) ${med.dosage} - PPA: ${med.ppa} DA, Chifa: ${med.chifa}`,
    url: location.href, // current URL (will be a deep link after #1 ships)
  }};
  if (navigator.share) {{
    await navigator.share(shareData);
  }} else {{
    // Fallback: copy to clipboard
    await navigator.clipboard.writeText(shareData.url);
    toast.success("Lien copié");
  }}
}};
```

3.3 Estimated Effort

FIX	EFFORT	DEPENDENCY
Web Share API integration	2 hours	None — can ship now
«Copier le lien» button	1 hour	Feature #1 (needs real medication URL)
Share as text/image (OG card)	1 day	Feature #1 (needs OG image per medication)

CHAPTER 04

Summary & Assessment

COPYABLE URL

0

WEB SHARE API

3

GAPS

FINAL VERDICT · CONTENT READY, MECHANISM MISSING

The Sharing System has **excellent shareable content** (brand, DCI, price, reimbursement, AMM, 7/7 completeness) but **no sharing mechanism**. No copyable URL, no «Copier le lien» button, no Web Share API. The «Partager» button opens the modal but doesn't share anything. The fix is small: add Web Share API (2 hours, no dependency) + «Copier le lien» button (1 hour, depends on Feature #1 routing migration). Grade: C+ (content is A, mechanism is F).

Immediate Next Steps

1. Add Web Share API to the «Partager» button handler (2 hours, ships immediately).
2. Add «Copier le lien» button in the modal action bar (1 hour, after Feature #1).
3. Generate per-medication OG images for social card sharing (1 day, after Feature #1).
4. Consider «Exporter la fiche» as PDF/image for email attachment (1 day).

49

Rich shareable content. No sharing mechanism. Add Web Share API + Copy Link. Grade: C+.
